

Cross-Board Communities in NBA Reddit Data

Community detection and PageRank ranking

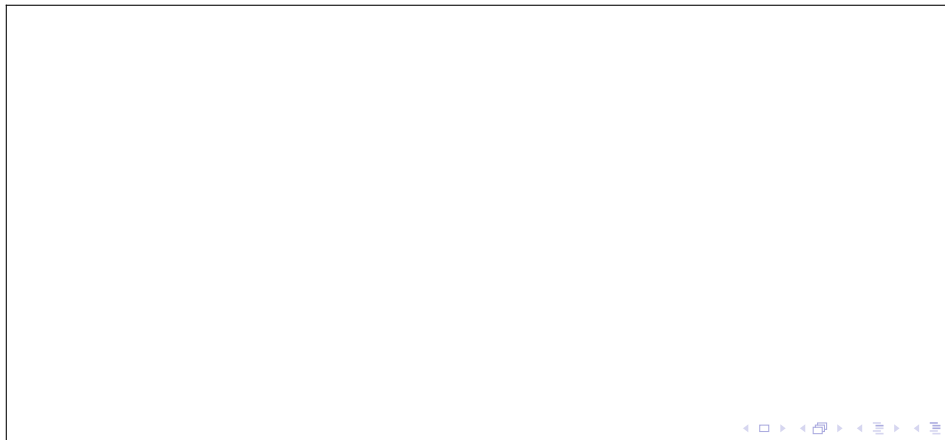

Applications of Computational Intelligence

January 16, 2026

- Reddit comment and submission exports stored under data/.
- Boards used for this presentation include NBA-focused subreddits (e.g., nba, nbadiscussion, lakers, bostonceltics, NBA_Draft).
- Records are JSONL/CSV with authors, IDs, parent IDs, and timestamps.

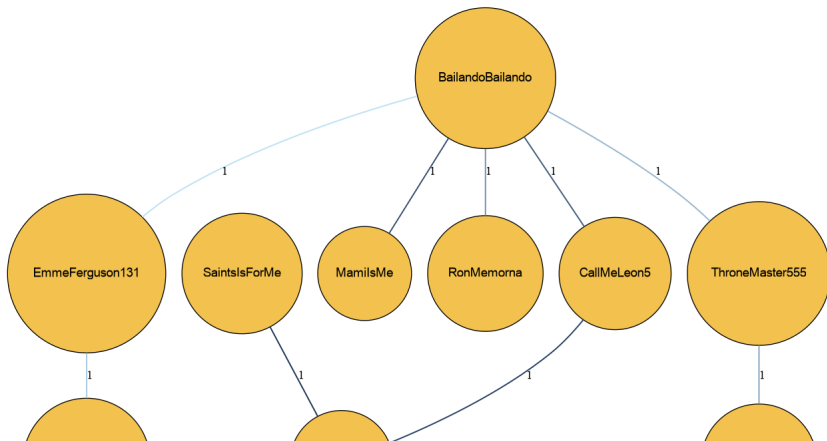

Board Wars and Conflict

- “Board wars” describe cross-board contention: users clash across different subreddit communities.
- We model interactions as reply edges between authors to expose conflict patterns.

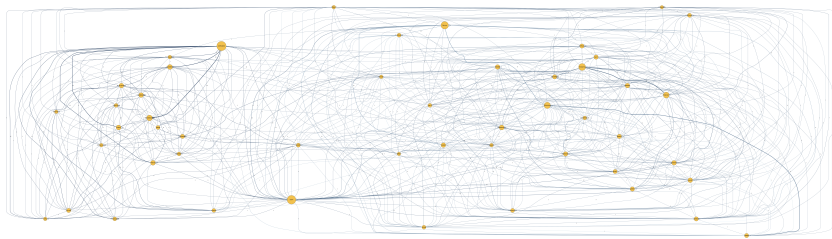

Single-Board Community Detection

- Build a user–user interaction graph within one board.
- Edge weight = reply frequency; nodes = authors.
- Label propagation groups densely connected users into communities.

Multi-Board Communities

- Focus only on cross-board users (active on 2+ NBA boards).
- Build a graph from their replies across all NBA boards.
- Select a 10–50 user community and rank members.

PageRank on the Community

- PageRank scores capture influence via weighted reply flow.
- Higher scores indicate central users who connect more of the dialogue.
- Node sizes in the graph reflect PageRank values.
